```

The specification describes polypeptides that bind April or BAFF. The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antig (BCMA). APRIL and BAFF are tumor necrosis family (TMF) members. The

antigen

for treating immune-relat such as graft rejection, inflammation.

Disclosure; SEQ ID NO 21; 140pp;

English

New polypeptides that inhibit APRIL and/or BAFF binding to BCMA, useful for treating immune-related disease, cancer or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and

The present sequence represents a BCMA (not defined) polypeptide. BCMA is a necrossis factor (NF)-kB activator. The method of the invention is used to identify compounds which modulate BCMA activity (and thus NF-kB activity). The specification describes a method of identifying a polypeptide which increases gene expression from a promoter. The method involves contacting a library of with a cell which expresses a recombinant anti-cell death gene and a reporter gene operably linked to the promoter, and then determining whether the expression of the reporter gene is altered as a result of contact with library. The method is useful for identifying polypeptides which increase or decrease gene expression from a promoter. The BCMA polypeptide or nucleic acid are useful for preparing a pharmaceutical composition for treating cancer, apoptosis, viral infections, inflammatory response, such as rheumatoid arthritis, inflammatory bowel disease or septic shock. BCMA is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polypeptides of the invention are useful for treating immune-related diseases, such as rheumatoid arrhritis, multiple sclerosis, and systubus erythematosus; cancer such as leukemia, lymphoma, or multiple scleroma; or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and inflammation. The present sequence represents an extracellular domain of BCMA.
                                                                                                                                                                                                                                                                                                   Identifying a modulator of gene expression for drug designing, by contacting a compound library with a cell expressing an anti-cell d gene and reporter gene, and determining alteration in reporter gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Key

            The present sequence represents a human BCMA protein, a B cell protein related to transmembrane activator and CAML-interactor (TACI) receptor. TACI is a tumour necrosis factor (TNF) receptor. The extracellular domains of BR43X2 (an isoform of TACI), TACI or BCMA (a related B cell protein) receptor contain a cysteine rich domain, and are used for inhibiting ztnf4 activity. Ztnf4 is a TNF ligand. They may also be used for inhibiting BR43X2, TACI or BCMA receptor-ligand engagement associated with activated or resting B lymphocytes, effector T-cells, or with antibody production. The antibody production is associated with an autoimmune disease selected from systemic lupus erythematosus, myasthenia gravis, multiple sclerosis and rheumatoid arthritis. The ztnf4 activity and BR43X2, TACI or BCMA receptor-ligand engagement is associated with asthma, bronchitis, emphysema, end stage renal failure.

TALL-1 and APRIL antagonists are used to block the interaction between APRIL and TALL-1 with TACI or BCMA. They are useful for treating a mammal suffering from cancer such as leukaemia, lymphoma, myeloma, cancers of lung and colon and autoimmune diseases e.g. rheumatoid arthritis, multiple sclerosis, psoriassis and lupus erythematosus. The present sequence is human BCMA protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ś
         regulate monocyte, macrophage and B lymphocyte mediated immune responses. TALL-1 protein is useful for identifying compounds that regulate B lymphocyte proliferation. It is also useful for treating B lymphocyte associated autoimmune disorders like rheumatoid arthritis, systemic lupus erythematosus (SLB), insulin dependent diabetes mellitus, multiple sclerosis, myasthenia gravis, Grave's disease, autoimmune haemolytic anaemia, autoimmune thrombocytopenia purpura, Goodpasture's syndrome, pemphigus vulgaris, acute rheumatic fever, post-streptococcal glomerulonephritis, or polyarteritis nodosa. The TALL-1 protein and its corresponding nucleic acid sequence are also useful in diagnostic assays. The present sequence is a human B cell maturation factor (BCMA) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; Tumour Necrosis Factor; TNF; immunosuppressant; TALL-1;

The invention relates to the use of a BAFF receptor (BAFF-R, also known as BCMA) protein, or a BAFF-R fusion protein as an agent for the treatment of a variety of immune-related disorders. BAFF-R is a member of the TNF (tumour necrosis factor) family, acting as an immunoregulatory agent, and also plays a role in the development of hypertension and related disorders. BAFF-R, fusion proteins containing it, and BAFF-R specific antibodies can be used for inhibiting B-cell growth, dendritic cell-induced B-cell growth and maturation, and immunoglobulin production, and in the treatment of autoimmune disorders. Breell lymphoproliferative disorders, hypertension and renal disorders. The BAFF-R proteins may also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         16. In human tissues, BCMA is expressed by spleen and lymph nodes but by brain, muscle, heart, lung, kidney, pancreas, testis and placenta. BCMA mRNA is absent in the pro-B lymphocyte stage but its expression increases with B lymphocyte maturation

The BAFF-R proteins or BAFF-R specific antibodies may be used for treating, suppressing or altering an immune response involving a signalling pathway between BAFF-R and BAFF, thereby inhibiting inflammation. Since BAFF-R inhibits B-cell growth and maturation it is useful for treating diseases such as systemic lupus erythematosus, autoimmune haemolytic anaemia, Grave's disease, multiple myeloma, B-cell carcinomas, leukaemia, rapidly progressive glomerulonephritis, and lymphomas. Nucleic acids encoding human BAFF-R may be used in gene therapy to treat tumours, lymphomas, autoimmune disorders and inherited B-cell-associated disorders. The
                                                                                                                                                                                                                                       Treating a mammal for a condition associated with undesired cell proliferation such as cancer or carcinoma, comprises administering a composition comprising A Proliferation Inducing Ligand Receptor (APRIL-R)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 06-OCT-1999; 99US-0157933P

The invention relates to a method of treating a mammal for a condition associated with undesired cell proliferation such as cancer or carcinor. The method involves administering a composition comprising A Proliferation Inducing Ligand Receptor (APRIL-R) also referred as B ce.

as B cell carcinoma.

The present invention describes a human tumour Disclosure; Page 135-136; 154pp; English.

This method is useful for treating undesired cell proliferation such as cancer or carcinoma e.g. human lung carcinoma, colon carcinoma, breast carcinoma, prostate carcinoma, and other carcinomas whose proliferation is modulated by APRIL. It is also useful for treating autoimmune diseases (Grave's disease, systemic lupus erythematosus SLE); hypertension, cardiovascular diseases, renal disorders, B-cell lympho-proliferative disorders, immunosuppressive diseases, organ transplantation, inflammation and human immunodeficiency virus (HIV), and for treating, suppressing or altering an immune response involving a signalling pathway between APRIL-R and its ligand. APRIL-R DNA is also useful in gene therapy. The present sequence is human APRIL-R also referred as BCMA or BCM protein
                                                                Novel isolated human tumor necrosis factor receptor Ztnfr 12, useful for treating autoimmune disorders, renal failure or renal disease and lymphoma.
                                                                                                                                                                                                                                                07-NOV-2000; 2000US-0246449P

CC designated Ztnfr12 (I). (I) has cytostatic, immunosuppressive, CC dermatological, antiinflammatory, neuroprotective, antidiabetic, CC antirheumatic, antiarthritic, antiasthmatic, nephrotropic and hypotensive CC activities, and can be used in gene therapy. (I) can be used for CC inhibiting, in a mammal, the activity of a ligand that binds Ztnff12 CC (e.g. ZTNF4), for treating disorders and diseases associated with B CC lymphocytes, activated B lymphocytes or resting B lymphocytes, and for CC inhibiting the proliferation of tumour cells. (I) is useful for treating CC autoimmune disorders such as systemic lupus erythematosus, myssthenia CC gravis, multiple sclerosis, insulin dependent diabetes mellitus, asthma, CC remunatoid arthritis, bronchitis, emphysema and end stage renal failure CC remulation arthritis, and pyelomephritis, and for treating renal CC complasms, multiple myelomas, lymphomas, light chain neuropathy, or cooplasms, multiple myelomas, lymphomas, light chain neuropathy, or cooplasms, multiple myelomas, lymphomas, light chain neuropathy, or complasms, multiple myelomas, lymphomas, light chain neuropathy, or complasment, for modulating develoment, for modulating develoment, for modulating develomen

Claim 8;

Page 255; 260pp; English

The invention relates to the manufacture of a composition for inhibiting the proliferation of tumour cells. The method involves using an antibody component that binds both the B-cell maturation antigen (BCMA) and the transmembrane activator and calcium-modulator and cyclophilin ligandinteractor (TACI). BCMA and TACI binding antibody compositions are useful

are useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is the protein sequence of a human polypeptide encoded by a gene that exhibits decreased expression in colon cancerderived metastases compared to normal colon tissue. It is an example of claimed polypeptides that are encoded by genes which are differentially expressed in metastatic colorectal cancer cells. Such polypeptides are useful in diagnostic and prognostic assays, for raising antibodies useful e.g. in immunotherapy, and in screening for modulator compounds of
                                                                                              B-cell maturation antigen and transmembrane activator and calcium-modulator and cyclophilin ligand-interactor, useful for treating disorders e.g. inflammation or lymphoma.
                                                                                                                                                                                                                                                                                                                                                                                                                              Key

                                                                                         The invention relates to fusion proteins comprising transmembrane activator and calcium modulator and cyclophilin ligand-interactor (TACI) receptor group that binds tumour necrosis factor-like protein (ZTNF)2 or ZTNF4; and an immunoglobulin group comprising a constant region of an immunoglobulin. The invention is used to manufacture a medicament for inhibiting the proliferation of tumour cells in a mammalian subject. The composition comprising the fusion protein may also be used in treating autoimmune diseases (e.g. systemic lupus erythematosus, multiple sclerosis, diabetes mellitus, rheumatoid arthritis and asthma), renal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Transmembrane activator; calcium modulator; nephrotropic; antibacterial; TACI; tumour necrosis factor-like protein; ZTNF2; ZTNF4; immunoglobulin; anaemia; gene therapy; cytostatic; antiinflammatory; immunosuppressive; glomerulonephritis; asthma; bronchitis; graft rejection; septic shock; dermatological; neuroprotective; cyclophilin ligand-interactor; human; autoimmune disease; systemic lupus erythematosus; multiple sclerosis; diabetes mellitus; rheumatoid arthritis; renal disease; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Transmembrane activator and calcium modulator and cyclophilin ligand-interactor (TACI)-immunoglobulin fusion protein, for treating cancer diabetes, comprises a TACI receptor group and an immunoglobulin group
diseases (e.g. glomerulonephritis), bronchitis, inflammation, graft rejection, anaemia and septic shock. The fusion proteins are also used gene therapy. The present sequence is human B-cell maturation receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; Col 100; 71pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                B-cell maturation receptor; BCMA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          for inhibiting proliferation of tumour cells, particularly inhibiting ZTNF4 activity in a mammal associated with increased endogenous antibody production or a disorder consisting to neoplasm, chronic lymphocytic leukaemia, multiple myeloma, non-Hodgkin's lymphoma, post-transplantation lymphoproliferative disease or light chain gammopathy or inflammation e.g. asthma. The invention is also useful in gene therapy. The present is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       24-MAY-2001; 2001US-0293343P

The invention relates to a novel TALL-1 antagonist protein, comprising a sequence that differs from SEQ ID NO:2, or amino acids 134-285 of SEQ ID NO:2. by at least one modification in the region connecting &bgr; strands D and E that reduces the biological activity of the TALL-1 antagonist as compared to wild-type TALL-1. A protein of the invention has immunosuppressive, antirheumatic, antiinflammatory, antiarthritic, dermatological, antidiabetic, neuroprotective, antithyroid, antipyretic, nephrotropic, and vasotropic activity. A TALL-1 antagonist may be used in a vaccine. A protein of the invention is useful for inhibiting TALL-1 biological activity in a mammal. TC is useful for treating autoimmune diseases, rheumatoid arthritis, systemic lupus erythematosus, insulin dependent diabetes mellitus, multiple sclerosis, myasthaenia gravis, Grave's disease, autoimmune hemolytic anaemia, autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           multiple sclerosis; myasthaenia gravis; Grave's disease; autoimmune hemolytic anaemia; autoimmune thrombocytopenic purpura; Goodpasture's syndrome; pemphigus vulgaris; acute rheumatic fever; post-streptococcal glomerulonephritis; polyarteritis nodosa; BCMA.

                          The invention relates to a novel antibody or its fragment, which CC immunospecifically binds tumour necrosis factor Delta (TNF-delta/APRIL). The antibody of the invention has dermatological, immunosuppressive, CC antiinflammatory, antitheumic, antiarthritic, cytostatic, antianaemic, antianlergic, antiasthmatic, neuroprotective, ophthalmological, CC tuberculostatic, antidiabetic, antipsoriatic, anti-HIV, CC tuberculostatic, vasotropic, thyromimetic, and haemostatic activity. CC antiarterioscolerotic, vasotropic, thyromimetic, and haemostatic activity. CC The antibody or its fragment are useful for treating, preventing or CC ameliorating cancer such as Non-Hodgkin's lymphoma or multiple myeloma in the control of the co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    disorders such as autoimmune neutropenia, haemolytic anaemia, dermatitis, asthma, allergic encephalomyelitis, myocarditis, multiple sclerosis, asthma, tuberculosis, diabetes mellitus, psoriasis, cancer of the immune system, particularly B cell cancers, immune disorders such as myasthenia gravis, Hashimoto's disease, immunodeficiency syndrome, Bruton's disease, infectious disease (e.g. acquired immunodeficiency syndrome (AIDS)), and proliferative disorders (e.g. leukemia). The present sequence represents the tumour necrosis factor BCMA
                                                                                                            The present sequence represents a human BCMA polypeptide. The specification also describes TACI and BR3 polypeptides. TACI and BR3 are receptors. Tumour necrosis factor (TNF) family ligands TALL-1 and April bind to the TACI receptor, while TNF family ligands TALL-1 also binds to BR3 receptor. The TACI and BR3 receptor nucleic acid is useful for preparing a composition for treating systemic lupus erythematosus
                                                                                                                                                                                                                                           New nucleic acid encoding a TACIs or BR3 polypeptide, useful for preparing a composition for treating systemic lupus erythematosus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ABP97717 standard; protein;

                                                                                                                                                                                                                                                                                                       The present invention describes an isolated polynucleotide (I), which is CC overexpressed in haematological malignancies, and which encodes a CC polypeptide or an immunogenic fragment of the polypeptide. Also CC described: (I) an isolated polypeptide; (2) an expression vector CC comprising (I) operably linked to an expression control sequence; (3) a CC host cell comprising an expression vector; (4) an isolated antibody that specifically binds to the polypeptide or its immunogenic fragment; and CC specifically binds to a polypeptide or its immunogenic fragment, encoded by (I). (I) has cytostatic and immunostimulant activities, and can be used in vaccines and immunotherapy. The immunoconjugates are useful in CC the manufacture of a medicament, particularly as active ingredients in a CC composition for treating cancer, e.g. multiple myeloma cell, chronic CC lymphocytic leukaemia, B cell leukaemias, or lymphomas in humans, sheep, CC primates, goats, bovines, equines, porcines, lupines, canines or felines. CC cancer agents, and generating antibodies or immunoconjugates for treating CC concer agents, and generating antibodies or immunoconjugates for treating CC concer agents, and generating antibodies or immunoconjugates. The polymucleotide, crombe used for detecting, diagnosing or CC prognosticating the haematological malignancies described above. The present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antiinflammatory activity, and may have a use in gene therapy. The methods, BCMA, and antibodies are useful for treating a neurodegenerative immunological disorder such as multiple sclerosis, demyelination or CNS inflammation. The present sequence represents human BCMA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel method for treating a neurodegenerative immunological disorder, demyelination or Central Nervous System (CNS) inflammation in a mammal. See the comprises administering B-cell maturation antigen (BCMA). Or an antibody against BCMA or a BCMA ligand (the mammal has or is at risk of developing multiple sclerosis). The method of the invention has neuroprotective, nootropic, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating a neurodegenerative immunological disorder, e.g. demyelination or inflammation in a mammal comprises administering a B-cell maturation antigen (BCMA), an antibody against BCMA or a BCMA ligand.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to an isolated monoclonal antibody which binds to a transmembrane activator of and CAML interactor (TACI) receptor. The TACI antibodies are useful for modulating TALL-1 or TACI polypeptide biological activity in mammalian cells, or for diagnosing and treating pathological conditions associated with TMF and TMF receptor-related molecules, e.g. cancer or immune-related disease, such as systemic lupus erythematosus, rheumatoid arthritis, Sjogren's syndrome, systemic vasculitis, diabetes mellitus, Crohn's disease, glomerulonephritis, multiple sclerosis, psoriasis, asthma, urticaria or infection, fungal infection, protozoal infection and parasitic infection.

                                                                                                                                                                               CC TALL-1, THANK and BAFF) is capable of binding neutrokine-alpha receptor and is selected from full length or mature neutrokine-alpha procein. The CC protein conjugate of the invention is useful in a complex with a metal CC ion associated with the chelator which is useful for administering administering the complex to the subject, where it is cadministered as an injectable solution, and the subject, where it is cadministered as an injectable solution, and the subject has a B-cell conjugate of the subject has a condition chosen from non-Hodgkin's CC lymphoma, chronic lymphocytic leukaemia, multiple myeloma, systemic lupus carcer, which involves administering it to a subject has a B-cell cancer, which involves administering it to a subject having cancer, where it is carcle of the cancer expresses a neutrokine-alpha receptor on its call of the cancer is a B cell cancer, which is chosen from non-CC Hodgkin's lymphoma, multiple myeloma and chronic lymphocytic leukaemia. The complex is also useful for treating an autoimmune disease or complex is also useful for treating an autoimmune disease or complex is syndrome. The complex may also be used for diagnostic is maging. A composition comprising the protein conjugate or the complex is creptor, which involves contacting the cell bearing aneutrokine-alpha receptor, which involves contacting the cell with the composition to kill the cell in the cell is lymphocyte, B cell or cancerous cell that the tell is lymphocyte, B cell or cancerous cell that the lymphatic system.

                                                                                                                                                         The present invention describes an isolated PRO nucleic acid (I). Also CC described: (I) a vector comprising (I); (2) a host cell comprising the vector of (I); (3) a process for producing a PRO polypeptides; (4) an CC isolated PRO polypeptide; (5) a chimeric molecule comprising the CC polypeptide of (4) fused to a heterologous amino acid sequence; (6) an antibody which specifically binds to a polypeptide of (4); (7) a CC composition of matter comprising a polypeptide of (4), an agonist or CC polypeptide in combination with a carrier; (8) an article of manufacture comprising a container, a label on the container and a composition of CC mammal; (10) a method for determining the presence of a PRO polypeptide in a sample suspected of having the presence of a PRO polypeptide (11) a method of identifying a compound that inhibits or CC mimics the activity of or expression of a gene encoding a PRO polypeptide (2); and (13) a method of identifying a compound that inhibits or CC mimics the activity of or expression of a gene encoding a PRO polypeptide (2); and (13) a method of stimulating the immune response in a mammal. The RRO sequences have antiallergic, antianemic, antiarthritic, compared to the encoded polypeptides, compositions, kits and methods are useful in diagnosing and treating an immune related disease and in CC stimulating an immune response. The present sequence represents a human CC protein from the present invention.

                                                                                                                                                                                                                                                                                                                                                  The invention provides novel tumor necrosis factor receptor ztnfr14 polynucleotides ADZ67754, expression vectors and antibodies. Ztnfr14 polynucleotides are used in claimed methods for detecting a genetic abnormality in a patient and for detecting a cancer in a patient. Recombinant ztnfr14 polypeptide, optionally conjugated to a coxin, is used in a claimed method of killing cancer cells. Ztnfr14 polypeptides can be used to detect ligands, agonists and antagonists. The polypeptides can be used to detect ligands, agonists and antagonists. The polypeptides, polynucleotides and antibodies may also be used in methods that modulate tumor growth, metastasis, and immunity such as separating resting from stimulated immune cells. The present sequence is that of human TMPR BCMA. This sequence was compared with that of ztnfr14 in the identification of ztnfr14 as a member of the TNPR family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        14-JUL-2005

                                                                                                                                                                                                                                              Š
                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes a method of inhibiting the growth of a cell that CC expresses a protein comprising contacting the cell with an antibody, Ci oligopeptide or organic molecule that binds to the protein, the binding CC of the antibody, oligopeptide or organic molecule to the protein and CC causing an inhibition of growth of the cell. Also described is a method CC causing an inhibition of growth of the cell. Also described is a method CC cincreased expression or activity of a protein having at least 80 % amino CC acid sequence identity to: a polypeptide having at least 80 % amino CC companies of (a), lacking its associated signal peptide; an extracellular CC domain of the polypeptide having the amino acid sequence of (a), with or CC without its associated signal peptide; an extracellular CC sequence of (a), 11, 15, 19, 21, 48 and 50; or a polypeptide encoded by any of CC sEQ ID No: 1, 7, 9, 11, 15, 19, 21, 48 and 50; or a polypeptide encoded by the full-length coding region of the nucleotide sequence of (d), CC comprising administering to a subject in need of such treatment an CC call proliferative disorder. Also disclosed are anti-tumor antigens of the invention. The methods and compositions of the present invention are useful for treating hematopoietic and malignant tumors in mammals. This is the anino acid sequence of tumor antigen of hematopoietic origin
                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The specification describes polypeptides that bind April or BAFF. The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antigen (BCWA). APRIL and BAFF are tumor necrosis family (TWF) members. The polypeptides of the invention are useful for treating immune-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; SEQ ID NO 20; 140pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polypeptides that inhibit APRIL and/or BAFF binding to BCMA, useful for treating immune-related disease, cancer or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and

                                                                                                                                                                                                                                                                 Ś
                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to the use of a BAFF receptor (BAFF-R, also known CC as BCMA) protein, or a BAFF-R fusion protein as an agent for the CC treatment of a variety of immune-related disorders. BAFF-R is a member of CC the TWF (thunour necrosis factor) family, acting as an immunoregulatory agent, and also plays a role in the development of hypertension and CC related disorders. BAFF-R, fusion proteins containing it, and BAFF-R, cc specific antibodies can be used for inhibiting B-cell growth, dendritic CC cell-induced B-cell growth and maturation, and immunoglobulin production, and in the treatment of autoimmune disorders, B-cell lymphopproliferative disorders, hypertension and renal disorders. B-cell lymphopproliferative CC infection, and in patients undergoing organ transplantation. The BAFF-R groteins or BAFF-R and BAFF-R proteins may also be used in the treatment of immunosuppressive disorders and HIV CC infection, and in patients undergoing organ transplantation. The BAFF-R cc suppressing or altering an immune response involving a signalling pathway be tween BAFF-R and BAFF-R thereby inhibiting inflammation. Since BAFF-R cc inhibits B-cell growth and maturation it is useful for treating diseases cc such as systemic lupus erythematosus, autoimmune haemolytic anaemia, rapidly grave's disease, multiple myeloma, B-cell carcinomas, leukaemia, rapidly crave's disease, multiple myeloma, B-cell carcinomas, leukaemia, rapidly comparising a mouse lgG-kappa signal sequence, residues 1-153 of human BAFF-R and a human gG-kappa signal sequence, residues 1-153 of human cc standardise of G field)

Human; A Proliferation Inducing Ligand Receptor; APRIL-R; cytostatic; gene therapy; cancer; nephrotropic; renal disorder; autoimmune disease; carcinoma; lung; colon; breast; prostate; Grave's disease; hypertension; systemic lupus erythematosus; SLE; inflammation; cardiovascular disease; B-cell lympho-proliferative disorder; BCM; immunosuppressive disease; organ transplantation; HIV; human immunodeficiency virus; TNF; murine; tumour necrosis factor; B cell maturation protein; BCMA; fusion protein; immunoglobulin G; IgG; Fc region.
                           by APRIL. It is also useful for treating autoimmune diseases (Grave's disease, systemic lupus erythematosus-SLE); hypertension, cardiovascular diseases, renal disorders, B-cell lympho-proliferative disorders, immunosuppressive diseases, organ transplantation, inflammation and human immunodeficiency virus (HIV), and for treating, suppressing or altering an immune response involving a signalling pathway between APRIL-R and its ligand. APRIL-R DNA is also useful in gene therapy. The present sequence is a fusion construct containing human APRIL-R also referred as BCMA or BCM protein, Fc region of human immunoglobulin G (IgG) and a signal sequence from murine Ig kappa cDNA. (Updated on 11-SEP-2003 to
                                                                                                                                                                                                                  Proliferation Inducing Ligand Receptor (APRIL-R) also referred as B cell maturation protein (BCM or BCMA) antagonist that antagonises the interaction between ARISI and its cognate receptor(s). This method is useful for treating undersired cell proliferation such as cancer or carcinoma e.g. human lung carcinoma, colon carcinoma, breast carcinoma, prostate carcinoma, and other carcinomas whose proliferation is modulated prostate carcinoma, and other carcinomas whose proliferation is modulated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treating a mammal for a condition associated with undesired cell proliferation such as cancer or carcinoma, comprises administering a composition comprising A Proliferation Inducing Ligand Receptor (APRIL-R)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mus
                                                                                                                                                                                                                                                                                                                                        The invention relates to a method of treating a mammal for a condition associated with undesired cell proliferation such as cancer or carcino The method involves administering a composition comprising A

                                                The invention relates to a novel method for treating a neurodegenerative immunological disorder, demyelination or Central Nervous System (CNS) inflammation in a mammal. The method comprises administering B-cell maturation antigen (BCMA), or an antibody against BCMA or a BCMA ligand (the mammal has or is at risk of developing multiple sclerosis). The method of the invention has neuroprotective, nootropic, and antiinflammatory activity, and may have a use in gene therapy. The methods, BCMA, and antibodies are useful for treating a neurodegenerative immunological disorder such as multiple sclerosis, demyelination or CNS
                                                                                                                                                                                                       Treating a neurodegenerative immunological disorder, e.g. demyelination or inflammation in a mammal comprises administering a B-cell maturation antigen (BCMA), an antibody against BCMA or a BCMA ligand.

                                       Genoxit activity for preventing or treating obesity. Genoxit is a member of the Tumour Necrosis Factor Receptor Super Family and is a Type III transmembrane protein. The agonists or antagonists of the invention are useful for treating or preventing obesity-related diseases or disorders, e.g. obesity, insulin resistance, atherosclerosis, atheromatous disease, heart disease (e.g. cardiac insufficiency, coronary insufficiency, high blood pressure), hypertension, stroke, syndrome X, diabetes mellitus (type I and II), hyperlipidaemia and hyperuricaemia, also diabetic complications, e.g. microangiopathic lesions, ocular lesions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Type III transmembrane protein; insulin resistance; atherosclerosis; atheromatous disease; heart disease; hypertension; stroke; syndrome X; diabetes mellitus; hyperlipidaemia; hyperuricaemia.

                                                                                                                                                                                                      protein or cellular protein isoforms (II) dependent on heat shock protein (HSP)-90, or selectively treating cells expressing (II) involving administering HSP90-inhibitor. The method is useful for treating genetically-defined disease with chromosomal aberration yielding oncogenic fusion protein, treating cancerous cells containing fusion protein in heterogeneous cell population, treating proliferative disease (e.g. rheumatoid arthritis or cancer) associated with mutant protein or cellular protein isoform dependent on heat shock protein (HSP)-90 (e.g. p53), or selectively treating cells expressing mutant protein or cellular protein isoform in a patient heterozygous for (II). The method is useful for treating a disease e.g. haematopoietic disorder such as T or B cell lymphoma, chronic myeloid leukaemia (CML), APL, AML, NHL, and CMML, lymphoma, chronic myeloid leukaemia (CML), APL, ALL, AML, NHL, and CMML,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chromosome aberration; oncogenic fusion protein; cancer; proliferative disease; cellular protein isoform; heat shock protein 90; HSP-90; rheumatoid arthritis; cancer; haematopoietric disorder; T cell lymphona; B cell lymphoma; chronic myeloid leukaemia; CML; acute myeloid leukaemia; AML; chronic myelomonocytic leukaemia; CMML; acute lymphoblastic leukaemia; ALL; APL; NHL; solid tumour; papillary thyroid carcinoma; Ewing's sarcoma; melanoma; liposarcoma; rhabdomyosarcoma; synovial sarcoma; viral infection.
                                                                  lymphoma, chronic myeloid leukaemia (CML), APL, ALL, AML, NHL and CMML, or a disease characterised by a solid tumour such as papillary thyroid carcinoma, Ewing's sarcoma, melanoma, liposarcoma, rhabdomyosarcoma and synovial sarcoma. The method is also useful for treating viral infections. This represents a protein encoded by the DNA sequence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating genetically-defined disease associated with chromosomal aberrations yielding oncogenic fusion proteins, e.g. cell proliferative diseases, involves administering an inhibitor of heat shock protein 90.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cell population,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          associated with chromosomal aberrations yielding oncogenic fusion proteins (I), treating cancerous cells containing (I) in a heterogeneous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes a method of treating genetically-defined disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Page 189-190; 389pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S
Specific binding partner for APRIL (G70, a tumour necrosis factor-TNF C family ligand), having the consensus region of TACI, ECMA, or the TACI/C BCMA extracellular consensus sequence, but not the extracellular region of TACI or BCMA. The method is useful for inhibiting activity of TACI or BCMA. The method is useful for treating B-cell or T-cell and/or BCMA in a mammal which is useful for treating B-cell or T-cell C Imphoproliferative disorders, one or more solid tumours such as lung, CC gastrointestinal, pancreatic or prostate tumour. APRIL, BCMA and TACI C diseases such as diarrhoea, psoriasis, allergies, pneumonia, atopic CC dermatitis, respiratory allergic disease (asthma, hypersensitivity lung CC (Crohn's disease, colitis), scleroderma, autoimmune disease, colitis), scleroderma, autoimmune disease (multiple CC (Crotn's disease, colitis), systemic lupus erythematosus), fungal, bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer with leucocyte infiltration of the skin or organs. protein (BCMA) activity in a mammal. The method comprises administering specific binding partner for APRIL (G70, a tumour necrosis factor-TWF family ligand), having the consensus region of TACI, BCMA, or the TACI/BCMA extracellular consensus sequence, but not the extracellular region of TACI or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA in a mammal which is useful for treating B-cell or T-cell
                                                                                                                                                                                                                                                                                                                            Inhibiting activity of B cell maturation protein and/or transmembrane activator and intracellular cyclophilin ligand interactor, by administering a binding partner for APRIL, a tumor necrosis factor fan
